

TENSOMETRIC SCALES

Tensometric scales are designed to weigh the batches of one or more bulk materials for subsequent mixing or other processing. These weights may have a weighing range of several tens of grams to several tons.

The weights are mostly cylindrical with a conical dump, but the shape and size of the container can be adapted to the size of the batch of materials, their mechanical properties and especially the available space. The scales are closed against dust leakage and have autofilters.

The dosing weights include screw conveyor conveyors.

Standard standard dosing scales are 500 kg and 1000 kg.
